

环境说明

```
[root@localhost ~]# cat /etc/redhat-release
CentOS Linux release 7.6.1810 (Core)
[root@localhost ~]# cat /proc/version
Linux version 3.10.0-957.el7.x86_64 (mockbuilder@kbuilder.bsys.centos.org) (gcc version 4.8.5 20150623 (Red Hat 4.8.5-36) (GCC)) #1 SMP Thu Nov 8 23:39:32 UTC 2018
[root@localhost ~]#
```

关闭 Selinux

```
vi /etc/selinux/config
```

```
# This file controls the state of SELinux on the system.
# SELINUX= can take one of these three values:
#       enforcing - SELinux security policy is enforced.
#       permissive - SELinux prints warnings instead of enforcing.
#       disabled - No SELinux policy is loaded.
SELINUX=disabled
# SELINUXTYPE= can take one of three values:
#       targeted - Targeted processes are protected,
#       minimum - Modification of targeted policy. Only selected processes are protected.
#       mls - Multi Level Security protection.
SELINUXTYPE=targeted
```

保存退出后重启系统

```
# reboot
```

```
[root@localhost ~]# vi /etc/selinux/config
[root@localhost ~]# reboot
```

临时关闭防火墙

```
# systemctl stop firewalld.service
# systemctl disable firewalld.service
```

```
[root@localhost ~]# systemctl stop firewalld.service
[root@localhost ~]# systemctl disable firewalld.service
Removed symlink /etc/systemd/system/multi-user.target.wants/firewalld.service.
Removed symlink /etc/systemd/system/dbus-org.fedoraproject.FirewallD1.service.
[root@localhost ~]#
```

安装所需所有软体仓库

```
# yum install -y httpd mariadb-server mariadb php php-mysql php-gd libjpeg* php-ldap
php-odbc php-pear php-xml php-xmlrpc php-mhash
```

```
[root@localhost ~]# yum install -y httpd mariadb-server mariadb php php-mysql php-gd libjpeg* php-ldap php-odbc php-pear php-xml php-xmlrpc php-mhash

```

编辑 httpd

```
# vi /etc/httpd/conf/httpd.conf
```

```
# any <VirtualHost> containers you may define later in the file.
#
# All of these directives may appear inside <VirtualHost> containers,
# in which case these default settings will be overridden for the
# virtual host being defined.
#
#
# ServerAdmin: Your address, where problems with the server should be
# e-mailed. This address appears on some server-generated pages, such
# as error documents. e.g. admin@your-domain.com
#
ServerAdmin root@localhost
#
#
# ServerName gives the name and port that the server uses to identify itself.
# This can often be determined automatically, but we recommend you specify
# it explicitly to prevent problems during startup.
#
# If your host doesn't have a registered DNS name, enter its IP address here.
#
#ServerName www.example.com:80
ServerName www.chenyang.com
#DirectoryIndex index.html index.php
#
# Deny access to the entirety of your server's filesystem. You must
# explicitly permit access to web content directories in other
# <Directory> blocks below.
#
<Directory />
    AllowOverride none
    Require all denied
</Directory>
```

配置中国时区

```
# vi /etc/php.ini
```

```
... or with a path:  
;  
; extensions=path/to/extension/msql.so  
  
; If you only provide the name of the extension, PHP will look for it in its  
; default extension directory.  
  
;;;  
; Note: packaged extension modules are now loaded via the .ini files  
; found in the directory /etc/php.d; these are loaded by default.  
;;;

```

启动 httpd, mysqld

```
# systemctl start httpd
```

```
# systemctl enable httpd
```

```
# systemctl start mariadb
```

```
# systemctl enable mariadb
```

```
[root@localhost ~]# systemctl start [service_name]
[root@localhost ~]# systemctl enable [service_name]
```

```
[root@localhost ~]# systemctl start mariadb
[root@localhost ~]# systemctl enable mariadb
Created symlink from /etc/systemd/system/mariadb.service to
[root@localhost ~]#
```

初始化 mysql 数据库，并配置 root 用户密码

```
# mysqladmin -u root password 56023000
```

```
# mysql -uroot -p
```

```
[root@localhost ~]# mysqladmin -u root password 56023000
[root@localhost ~]# mysql -uroot -p
Enter password:
Welcome to the MariaDB monitor.  Commands end with ; or \g.
Your MariaDB connection id is 3

Query OK, 0 rows affected (0.00 sec)

MariaDB [(none)]> quit
Bye
```

安装依赖包 + 组件

```
# yum -y install net-snmp net-snmp-devel curl curl-devel libxml2 libxml2-devel
libevent-devel.x86_64 javacc.noarch javacc-javadoc.noarch javacc-maven-plugin.noarch
javacc*
[root@localhost ~]# yum -y install net-snmp net-snmp-devel curl curl-devel libxml2 libxml2-devel libevent-devel.x86_64 javacc.noarch javacc-javadoc.noarch javacc-maven
-plugin.noarch javacc*
```

```
# yum install -y php-bcmath php-mbstring
```

```
| [root@localhost ~]# yum install -y php-bcmath php-mbstring
```

```
# rpm -ivh
```

```
http://repo.zabbix.com/zabbix/4.0/rhel/7/x86\_64/zabbix-release-4.0-1.el7.noarch.rpm
```

```
[root@localhost ~]# rpm -ivh http://repo.zabbix.com/zabbix/4.0/rhel/7/x86\_64/zabbix-release-4.0-1.el7.noarch.rpm
```

```
# yum install zabbix-server-mysql zabbix-web-mysql -y
```

```
| [root@localhost ~]#
| [root@localhost ~]# yum install zabbix-server-mysql zabbix-web-mysql -y
```

```
# cd /usr/share/doc/zabbix-server-mysql-4.0.21/
```

```
# zcat create.sql.gz | mysql -uchenyang -p -h 172.16.20.53 zabbix
```

```
[root@localhost ~]# cd /usr/share/doc/zabbix-server-mysql-4.0.21/
[root@localhost zabbix-server-mysql-4.0.21]# ls
AUTHORS ChangeLog COPYING create.sql.gz NEWS README
[root@localhost zabbix-server-mysql-4.0.21]# zcat create.sql.gz | mysql -uchenyang -p -h 172.16.20.53 zabbix
Enter password:
```

配置时区，并设置加入开机自启动 zabbix-server

```
# vi /etc/httpd/conf.d/zabbix.conf
```

将

```
# php_value date.timezone Europe/Riga
```

变更成

```
php_value date.timezone Asia/Shanghai
```

```
<Directory "/usr/share/zabbix">
    Options FollowSymLinks
    AllowOverride None
    Require all granted

    <IfModule mod_php5.c>
        php_value max_execution_time 300
        php_value memory_limit 128M
        php_value post_max_size 16M
        php_value upload_max_filesize 2M
        php_value max_input_time 300
        php_value max_input_vars 10000
        php_value always_populate_raw_post_data -1
        php_value date.timezone Asia/Shanghai
    </IfModule>
</Directory>

<Directory "/usr/share/zabbix/conf">
    Require all denied
</Directory>
```

修改完成之后保存退出编辑

```
# systemctl enable zabbix-server
```

```
# systemctl start zabbix-server
```

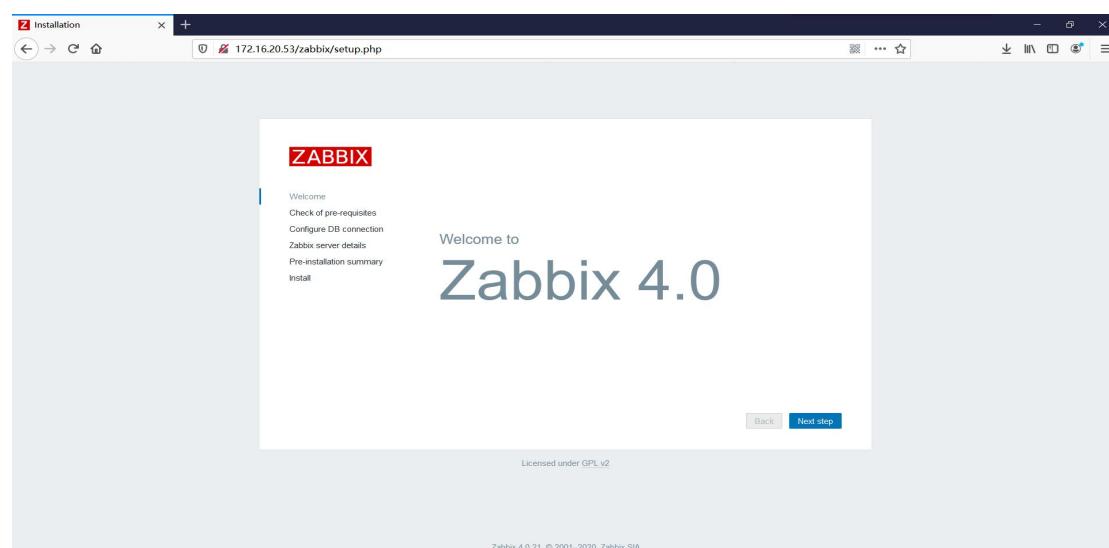

```
[root@localhost ~]# systemctl enable zabbix-server
Created symlink from /etc/systemd/system/multi-user.target.wants/zabbix-server.service to /usr/lib/systemd/system/zabbix-server.service.
[root@localhost ~]# systemctl start zabbix-server
```

reboot 将服务器重启一下

重启之后就可以开始安装 zabbix

浏览器输入

<http://myserver-ip/zabbix>

默认用户名 Admin 密码 zabbix

默认显示语言为英语

修改显示语言

The screenshot shows the Zabbix web interface with two windows open. The top window is a dashboard titled "Local" with a red arrow pointing to the user profile icon in the top right corner. The bottom window is the "User profile: Zabbix Administrator" page under the "User" tab. In the "Language" dropdown, "Chinese (zh_CN)" is selected and highlighted with a red box, while "English (en_US)" is the current selection. The URL in the browser is <http://172.16.20.53/zabbix/profile.php>. A warning message at the bottom left states: "Zabbix server is not running: the information displayed may not be current."

默认的访问路径

http://zabbix_server_ip/zabbix

为了方便使用将 URL 地址修改为

http://zabbix_server_ip

```
# vi /etc/httpd/conf/httpd.conf
```

```
[root@localhost ~]# vi /etc/httpd/conf/httpd.conf
```

修改如下内容：

默认为 /var/www/html/

修改为 zabbix 目录

DocumentRoot "/usr/share/zabbix"

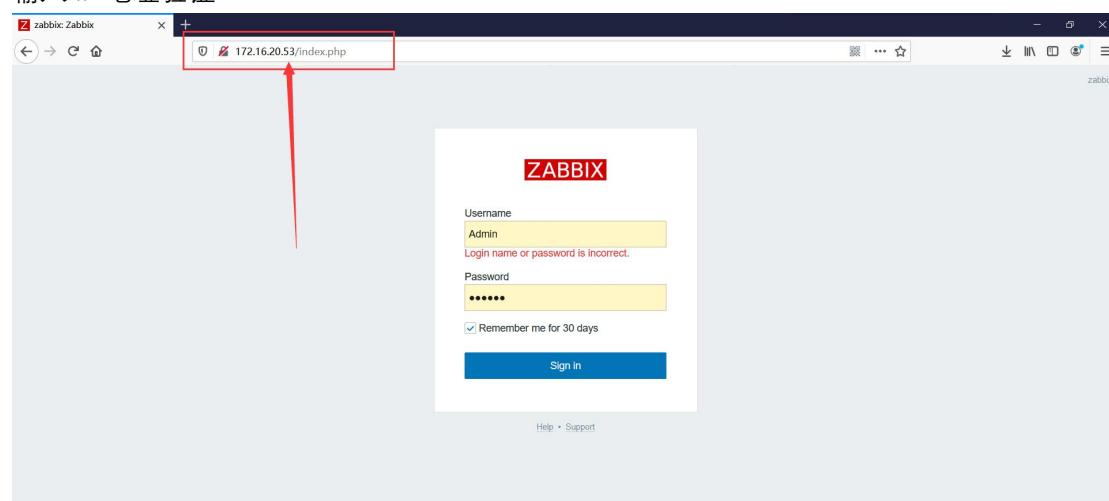

```
# DocumentRoot: The directory out of which you will serve your
# documents. By default, all requests are taken from this directory, but
# symbolic links and aliases may be used to point to other locations.
#
# DocumentRoot "/usr/share/zabbix"
#
# Relax access to content within /var/www.
#
<Directory "/var/www">
    AllowOverride None
    # Allow open access:
    Require all granted
</Directory>
```

保存退出

重启 httpd

```
[root@localhost ~]# systemctl restart httpd.service
```

输入 IP 地址验证

至此 zabbix 的平台就部署完成了。
